When making an HTTPS connection, let's assume that the client threw the following exception due to a failed handshake with the server:

```
javax.net.ssl.SSLHandshakeException: Received fatal alert: handshake_failure
```

Applying the `-Djavax.net.debug=all` property from above, the failure associated with this `SSLHandshakeException` would appear immediately after algorithm negotiation in the logs.

Avoid exception:

VM arguments

```
-Djavax.net.ssl.trustStore=/home/terryk/.esg/esg-truststore.ts -Djavax.net.ssl.trustStorePassword=changeit  
-Djavax.net.debug=all -Dhttps.protocols="TLSv1,SSLv3"
```

Program arguments it

```
--oid userOpenIDURL -P password --output outputfil
```
