EUPORIAS WP23: Impact Models for impact predictions

- **AQUATOOL:** It is a Water Management Tool with different modules (SIMGES, OPTIGES, SIMRISK). [?Model URL: http://www.upv.es/aquatool/index_E.html](http://www.upv.es/aquatool/index_E.html)
- **MORDOR:** It is a hydrological model for catchments in France.
- **E-HYPE:** This model simulates water flow and substances on their way from precipitation through soil, river and lakes to the river outlet. The catchment is divided into sub-basins, which in turn are divided into classes depending on land use, soil type and elevation. This Pan-European hydrological model with high resolution is operational in the SMHI production environment. It is operational to deliver real-time and forecast hydrological and nutrient data from the entire European coastline. - **VIC (Variable Infiltration Capacity model):** It is a hydrological impact model. [?Model URL: http://www.hydro.washington.edu/Lettenmaier/Models/VIC/index.shtml](http://www.hydro.washington.edu/Lettenmaier/Models/VIC/index.shtml)
- **CGMS (Crop Growth Modelling System):** Is a detailed crop model with representation of specific crop varieties. [?Model URL: http://www.marsop.info/marsopdoc/cgms92/5_en.htm](http://www.marsop.info/marsopdoc/cgms92/5_en.htm)
- **LPJml:** This model will be used for hydrological impacts and agricultural impacts. [?Model URL: http://www.pik-potsdam.de/research/projects/lpjweb](http://www.pik-potsdam.de/research/projects/lpjweb)
- **JULES:** The Joint UK Land Environment Simulator. It is a community land surface model that has evolved from the Met Office Surface Exchange Scheme (MOSES).
- **GUESS:** Impact model used by University of Lund.
- **GLAM:** This model is used by University of Leeds.

All these Impact Models require different variables with different temporal frequencies as input data:
